HandsMen Threads: Elevating the Art of Sophistication in Men's Fashion

Submitted by:

AARON O. ASUNCION

BSIT – 3

PROJECT OVERVIEW:

This project highlights the creation of a fully customized Salesforce CRM for HandsMen Threads, a premium menswear and tailoring brand. The objective of the implementation was to streamline internal operations, strengthen client engagement, and maintain consistent, reliable data across all departments.

The CRM was designed using a well-structured data model featuring five main custom objects: Customer, Order, Product, Inventory, and Marketing Campaign. Core business processes were automated using Record-Triggered Flows, Scheduled Flows, Email Alerts, and Apex, enabling the system to send order updates, adjust loyalty tiers, and automatically notify staff when inventory levels run low.

To ensure data integrity and secure sensitive information, the system was configured with strict validation rules and a role-based security setup specifically aligned with the Sales, Inventory, and Marketing teams. A scheduled Apex batch job was also implemented to routinely check and update items marked as low stock.

Overall, this CRM solution increased operational efficiency through automation, improved customer experience with personalized communication, and delivered a scalable platform that supports the ongoing growth of the business.

OBJECTIVE:

The main objective of this project is to build and implement a customized Salesforce CRM for HandsMen Threads that streamlines business operations, ensures accurate data management, and enhances the overall customer experience.

By creating a unified system that oversees customers, orders, products, inventory, and marketing activities, this project aims to:

- Automate essential processes such as sending order confirmation emails, updating customer loyalty tiers, and issuing low-stock alerts.
- Preserve consistent and trustworthy data across all departments through structured data entry and validation rules.

- Deliver real-time visibility into customer activity and inventory performance to support quicker, well-informed business decisions.
- Improve coordination among Sales, Marketing, and Inventory teams by implementing role-based access and secure permission controls.
- Strengthen customer connections through personalized messaging and marketing efforts centered on loyalty and engagement.

TECHNOLOGY DESCRIPTION:

Salesforce

Salesforce is a cloud-based Customer Relationship Management (CRM) platform that helps businesses organize customer data, automate workflows, and improve performance across sales, service, and marketing teams. It provides powerful configuration tools along with programmatic capabilities—such as Apex and Flows—that enable the creation of customized solutions tailored to specific business needs.

Custom Objects

In Salesforce, objects work similarly to database tables. Custom Objects are created to store data that is unique to a company's operations.

Examples include:

- Customer__c – Holds customer profile and contact details
- Product__c – Contains information about available products
- Order__c – Records customer order transactions

Tabs

Tabs serve as navigation points that let users quickly access and manage records for a specific object within Salesforce.

Example:

A Product tab allows users to easily view, create, and update product entries.

Custom App

A Salesforce App is a collection of tabs, components, and configurations packaged together to support a specific workflow, department, or business process.

Profiles

Profiles control what a user can see and do within Salesforce. They manage permissions for objects, fields, and various system features.

Roles

Roles determine the level of record access a user has, based on the organization's role hierarchy. They help manage data visibility, sharing, and reporting structures.

Permission Sets

Permission Sets allow administrators to grant users additional permissions without changing their assigned profile. They are useful for giving extra access when required.

Validation Rules

Validation Rules ensure that the information entered into Salesforce follows business standards before a record is saved.

Examples:

- An email address must include "@gmail.com"
- Inventory quantity cannot be entered as a negative value

Email Templates

Email Templates are ready-made message formats used to send standardized communications to customers or internal teams.

Example:

A template used for sending an Order Confirmation after a customer completes a purchase.

Email Alerts

Email Alerts are automated notifications—typically triggered through Flows or Workflow Rules—that send emails using specific templates.

Example:

Sending customers an automatic message whenever their loyalty tier is updated.

Flows

Flows are Salesforce's no-code automation tools that allow businesses to run processes such as updating or creating records, sending notifications, or guiding users through step-by-step screens.

Example:

A Flow that automatically sends an order confirmation email whenever a new order is submitted.

Apex

Apex is Salesforce's programming language, used to handle more advanced automation and logic that cannot be accomplished using standard configuration tools.

Example (Trigger use case):

- Recomputing the total order value when new items are added
- Deducting inventory quantities once an order has been finalized

DETAILED EXECUTION OF PROJECT PHASE

1. **Developer Org Setup** A Salesforce Developer Org was created using

<https://developer.salesforce.com/signup>.

The account was verified, password set, and access was granted to the Salesforce Setup page.

2. Custom Object Creation

To manage essential business information, five custom objects were set up in Salesforce:

- **HandsMen Customer** – Holds customer details such as full name, email address, contact number, and loyalty tier.
- **HandsMen Product** – Contains product catalog information, including SKU, pricing, and current stock levels.
- **HandsMen Order** – Logs customer purchase details such as item quantity, order date, and order status.
- **Inventory** – Monitors product stock counts and warehouse storage locations.
- **Marketing Campaign** – Stores information about promotional activities, including campaign schedules and target groups.

Steps to Create Custom Objects:

- Go to Setup → Object Manager → Create → Custom Object.
- Provide the object's Label and API Name, then enable features like Report visibility and Search availability.
- Save the object.
- Create a Tab for each custom object to make its records easily accessible in the Salesforce interface.

This structured setup ensures that all critical business data is stored in a centralized and easily manageable way, ready for automation and reporting.

3. Creating the Lightning App

- A custom Lightning App named HandsMen Threads was developed to consolidate all major business processes in one interface.
- The app included essential tabs such as HandsMen Customer, HandsMen Order, HandsMen Product, Inventory, Marketing Campaign, Reports, and any additional tabs required.
- It was assigned to the System Administrator profile to allow complete access and full management control.

4. Validation Rules

- To maintain data integrity and enforce key business requirements, several validation rules were set up:
- Order Object – Blocks the record from being saved if the Total Amount is less than or equal to zero.
- Error Message: "Please Enter Correct Amount"
- Customer Object – Ensures the Email field includes "@gmail.com" before the record can be saved.
- Error Message: "Enter a valid email address, such as name@emial.com"

5. User Role & Profile Setup

1. The **Standard User** profile was duplicated to create a new profile named Platform 1, which was granted access to all relevant custom objects.
2. **Roles** were established for each department to manage data visibility and organizational hierarchy:
 - Sales Manager
 - Inventory Manager
 - Marketing Team

6. User Creation

1. Users were added to Salesforce and assigned the appropriate profiles and roles based on their job functions:
 - **Niklaus Mikaelson** – Assigned the **Sales Manager** role

- **Kol Mikaelson** – Assigned the **Inventory Manager** role
2. These role-based assignments ensure secure access to data, proper workflow management, and accurate execution of business processes within the system.

7. Email Templates & Alerts

1. The following email templates were developed to facilitate automated communication:
 - **Order Confirmation** – Sent when an order is marked as Confirmed.
 - **Low Stock Alert** – Triggered when product inventory drops below 5 units.
 - **Loyalty Program Update** – Dispatched whenever a customer's loyalty status changes.
2. Corresponding **Email Alerts** were set up for each template and integrated with automation flows to deliver notifications promptly and accurately.

8. Flow Implementations

A. Order Confirmation Flow

- Automatically activates when an order's status changes to **Confirmed**.
- Sends a customized **Order Confirmation** email to the customer, keeping them promptly updated on their order.

B. Stock Alert Flow

- Triggered automatically when a product's inventory falls below 5 units.
- Sends a Low Stock Alert email to the Inventory Manager to ensure timely restocking.

C. Scheduled Loyalty Update Flow

- Runs daily at midnight.
- Iterates through all customers and updates their Loyalty Status based on cumulative purchases, ensuring the loyalty program is always current.

8. Apex Triggers

1. Order Total Trigger

- Automatically calculates the total amount for an order by multiplying the product quantity by its unit price.

2. Stock Deduction Trigger

- Automatically decreases inventory levels whenever an order is placed, ensuring accurate stock tracking.

3. Loyalty Status Trigger

- Updates a customer's loyalty tier based on their cumulative purchases, enabling automated rewards and benefits.

PROJECT EXPLANATION WITH REAL-WORLD EXAMPLE

Let's follow the experience of a customer using the Salesforce CRM system:

1. Customer Registration

- A customer, **Elijah Mikaelson**, visits the store or accesses the online website.
- A **Customer** record is created in Salesforce with his name, phone number, email, and other relevant details.
- **Validation Rule:** Ensures the email is formatted correctly (e.g., must include @gmail.com).

2. Product Setup

- The admin adds products, such as **Shirts** and **Jeans**, to the **Product__c** object.
- Each product record contains information such as price, SKU, and description.
- **Inventory** records are also created to monitor stock levels for every product.

3. Order Placement

- Elijah chooses to buy **2 shirts** priced at ₹2,500 each.
- A new **Order** record is created in Salesforce.

- **Apex Trigger:** Automatically calculates the **Total Amount**.
 - Example: $2 \times \text{₱}2,500 = \text{₱}5,000$

4. Inventory Update

- Immediately after the order is placed:
 - **Inventory Trigger:** Reduces the shirt stock by 2.
 - **Validation Rule:** Ensures inventory does not fall below 0, preventing negative stock levels.

5. Loyalty Program

- Elijah's cumulative purchases now total ₱5,000.
- A **Customer Apex Trigger** checks total spending and updates loyalty status according to defined tiers:
 - $< \text{₱}500 \rightarrow$ Bronze
 - $\text{₱}500\text{--}\text{₱}1,000 \rightarrow$ Silver
 - $\geq \text{₱}1,000 \rightarrow$ Gold
- In this case, Elijah is upgraded to **Silver** status.

6. Email Notifications

- Whenever a new order is placed or a loyalty status changes:
 - **Flow + Email Alert** is triggered.
 - Elijah receives a notification, e.g.:
"Thank you for your purchase! Your loyalty status is now Silver."

7. Users and Roles

- Salesforce users are created for staff, with appropriate roles and profiles:
- Niklaus Mikaelson – Sales Role (Platform 1 Profile)
- Kol Mikaelson – Inventory Role (Platform 1 Profile)

CONCLUSION

The deployment of the customized Salesforce CRM for **HandsMen Threads** effectively streamlined business workflows, enhanced data accuracy, and strengthened customer engagement. By implementing centralized objects for Customers, Products, Orders, Inventory, and Marketing Campaigns, the system provides an organized and efficient framework for managing key business processes. Automation using **Flows, Apex Triggers, and Email Alerts** minimized manual tasks, ensured timely notifications, and maintained accurate inventory and loyalty information. Role-based profiles and permissions secured sensitive data while promoting effective team collaboration. Overall, this CRM solution offers a scalable and robust platform to support business growth and improve the overall customer experience.

FUTURE SCOPE

- The Salesforce CRM for HandsMen Threads can be further expanded with several enhancements:
- Mobile Integration: Allow sales staff and managers to access the CRM on mobile devices for order updates, inventory checks, and customer communication on the go.
- Advanced Analytics & Reporting: Introduce dashboards and AI-driven insights to analyze sales trends, forecast inventory needs, and understand customer behavior.
- E-commerce Integration: Connect the CRM with online stores to enable real-time order management and automatic inventory updates.
- Enhanced Loyalty Programs: Develop tiered rewards, automated promotions, and personalized offers tailored to customer preferences.
- Chatbots & Customer Self-Service: Provide automated support for inquiries, order tracking, and product recommendations.
- Marketing Automation: Expand campaign management with targeted email campaigns, social media integration, and performance tracking.

These improvements will help HandsMen Threads further optimize operations, increase customer satisfaction, and support scalable growth for the business.
